Viewing Old Event Logs

Dashboard can maintain event logs for up to three months, which can be viewed for historical purposes.

To view logs older than 30 days:

1. Navigate to **Network-wide > Monitor > Event log**.
2. Click in the **Before** fields and specify a date and time.
3. Once the date and time have been selected, click the **Search** button to begin the search.

**Note:** Event logs are tied to the Dashboard network, not stored locally on the device. As such, swapping devices will not affect the event log, but moving devices to a new network will cause their device logs to be cleared.

**If a complete historical log is necessary,** implementing a syslog server is recommended to maintain logs as long as needed.
